

Class 3 EVS: Plants and Trees

Plants are living things that grow in the earth and have a stem, leaves, and roots.

There are many different types of plants. Trees are very large plants. They have a thick, woody stem called a trunk.

Shrubs are smaller than trees and have many thin, woody stems. Herbs are small plants with soft, green stems.

Plants need water, sunlight, and air to grow. They make their own food using sunlight. This process is called photosynthesis.

Roots hold the plant in the soil and absorb water. The stem carries water to the leaves. The leaves make food for the plant.
